AB An improved synthesis for the prepn. of high purity, racemic metallocene alkyls substantially free of alkali metal salts and meso isomer is disclosed. The process comprises (a) forming a reaction product in the presence of a solvent of a cyclopentadienyl ligand metal salt and a perhalogenated Group 4-6 transition metal compd. or its etherate complex; (b) combining the product of (a) with at least two molar equivalents of an alkylating agent; (c) sepg. the soln. from the subsequently formed solids; (d) removing the solvent to recover the metallocene alkyl compd., and; (e) washing the metallocene alkyl with solvent or solvent mixts. The metallocene alkyl compds. are particularly suitable for use as addn. or insertion polymn. catalysts when activated by a suitable polymn. cocatalyst. Thus, lithiation of [bis(2-methylbenz[e]indenyl)]dimethylsilane with BuLi in Et2O/hexane followed by treatment with in PhMe gave bright yellow soln. Grignard methylation of the obtained soln. with MeMgBr in Et2O followed by treatment with Me3SiCl in dioxane gave title compd., 24% rac-dimethylsilanediylbis(2-methylbenz[e]indenyl)zirconium di-Me.

 AB Bridged or unbridged metallocenes are prepd. in which the
 cyclopentadienyl ligands have 2 or 4 adjacent substituents which
 complete 1 or 2 C4-8 cycloalkylene groups. The metallocenes are
 useful as catalyst components for the polymn. of olefins, esp. the
 (co)polymn. of ethylene and the polymn. of propene. Cyclohexene and
 BzOH were used to prep. 2,3-cyclotetramethyleneindene which was
 reacted with Me₂SiCl₂ to give bis(2,3-cyclotetramethyleneinden-1-
 yl)dimethylsilane (I). Reacting I with ZrCl₄ gave
 dimethylsilanediylbis(2,3-cyclotetramethyleneinden-1-yl)zirconium
 dichloride which was used with iso-Bu₃Al in a catalyst system for
 the polymn. of ethylene.

AB Title complexes I [M = Group IVA, VA, or VIA metal; X1, X2 = H, halo, C1-20 (halogenated) hydrocarbyl, or O- or S-contg. group; R1 = C1-20 hydrocarbyl; R2 = halogenated C1-20-hydrocarbyl-substituted C6-16 aryl; Z = (halogenated) C1-20 hydrocarbylene, divalent Si-, Ge-, or Sn-contg. group; O, CO, S, SO, SO2, NR3, PR3, P(O)R3, BR3, or AlR3, R3 = H, halo, or (halogenated) C1-20 hydrocarbyl] are useful as highly active catalysts in the polymn. of olefins giving polyolefins having a high m.p. and a high mol. wt. I are used with organoaluminum cocatalysts or compds. that form ion pairs with I, and the catalysts may be supported on inorg. compds. A typical catalyst was manufd. by lithiation of 2-methyl-4-(p-trifluoromethylphenyl)indene, reaction of the lithiated product with Me2SiCl2, lithiation of the resulting product, and complexation of the 2nd lithiated product with ZrCl2.

AB The synthesis, crystal structure and propene polymn. behavior of 4 bridged zirconocene dichlorides is presented. All catalysts gave isotactic polypropene (iPP). Me substitutions at the 2-, 4- and 7-positions of the bridged bis(indenyl)zirconocene dichlorides were introduced. The Me substituent in the 7-position of the indenyl ring induces a significant steric interaction with the bridging group. On comparison of the 2,4,7-Me substituted catalysts with their unsubstituted counterparts, only the ethylidene bridged catalyst rac-1,2-ethylidene-bis(2,4,7-trimethyl-1-indenyl)zirconium dichloride (I) is forced into the optimum geometry for the polymn. Owing to the steric bulk at the bridge catalyst I is very rigid with respect to the movement of the indenyl rings and the metal center thus produces highly iPP even up to high polymn. temps. Mol. mechanics calcns. and temp.-dependent NMR measurements demonstrate that catalyst I is not able to equilibrate between the .lambda. and .delta. conformational state as the corresponding rac-1,2-ethylidene-bis(-1-indenyl)zirconium dichloride catalyst does. In the case of the catalyst isopropyliden((3-tert-butyl)cyclopentadienyl-9-fluorenyl)zirconium dichloride the substitution in the 3-position changes the symmetry from Cs to C1. This catalyst produces iPP but with a decreased polymn. activity.

OS CJELSEVIER

AB A variety of new silylene-bridged fluorenyl-contg. ligands has been synthesized with good yields via a convenient synthetic route. Two dimethylsilylene-bridged (.eta.5-indenyl)(.eta.5-fluorenyl) and (.eta.5-cyclopentadienyl)(.eta.5-fluorenyl) zirconocene dichlorides with C1 and Cs mol. symmetry have also been prepd. Upon activation with Me aluminoxane, the former produced a polypropylene of high mol. wt., but with low activity and isotacticity. The latter catalyzed non-stereospecific propylene polymn. without any syndiotactic tendency, but with 40 and 20 times greater ethylene and propylene activity resp. than the former catalytic system.

AB A racemic mixt. of a chiral, silicon bridged transition metal metallocene, useful as catalyst for olefin polymn., which is substantially free of meso isomer, is pptd. directly from a reaction mixt. as it is formed by reacting an org. solvent soln. of an alkali metal salt of a silicon bridged ligand with a transition metal tetrahalide-ether complex. Thus, lithiation of $\text{Me}_2\text{Si}(\text{indenyl})_2$ (prepn. given) with BuLi in hexanes/Et₂O gave 67% $\text{Li}_2\text{Me}_2\text{Si}(\text{indenide})_2 \cdot 2\text{OEt}_2$ which on treatment with $\text{ZrCl}_4(\text{THF})_2$ (prepn. given) in THF gave >99% rac-[1,1'-dimethylsilanylenebis(indenyl)]zirconium dichloride in 47.3% yield.

OS MARPAT 117:131730

AB The title polymers are obtained by olefin polymerization in the presence of aluminoxanes and bis(tetrahydroindenyl) transition metal complexes (I; R₁, R₂ = H, org.-group, halogen; R₃, R₄ = H, halogen, org. group optionally containing heteroatom or halogen; R₅, R₆ as for R₃, R₄ but not H; R₇ = org. or heteroatom-containing org. group; R₈, R₉, R₁₀ = H, halogen, org. group; m, n = 0-2, with m + n = 0-2; .mu. = IVb, Vb, VIb element). Thus, dimethylsilylenebis(2-methyl-4,5,6,7-tetrahydro-1-indene)zirconium dichloride (II) was obtained by hydrogenation of the methylindene analog. To propylene (12 dm³) mixed with 35 cm³ PhMe containing Me aluminoxane (52 mmol Al) at 30.degree. was added 5.3 mg II mixed with Me aluminoxane (20 mmol Al) and polymerization was undertaken at 70.degree. to provide isotactic polypropylene at 50.34 kg polymer/g II. The use of catalysts containing indene instead of tetrahydroindene or without substitution at the 2 position of the indene ring gave polymer with lower crystallinity and m.p.

AB Dimethyl(difluorenyl)silane, -germane and -stannane I (M = Si, Ge, Sn) are quant. obtained by a 1-pot synthesis from dimethyldichlorosilane, -germane and -stannane and two equiv. of fluorenyllithium. Monofluorenyl compds. II (X = Cl, F) can also be obtained selectively using a stoichiometric amt. of fluorenyllithium. Addn. of one or two equiv. of BuLi to I affords selectively the corresponding monolithio or dilithio derivs., resp., which can be quenched by MeI, Me₃SiCl or Me₂SiCl₂. An NMR study shows the great influence of the 2nd fluorenyl group on the chem. shifts of methyls bonded to metal, and on the hydrogen on C9 of the fluorenyl group.

I

AB Zr complexes contg. an amido-fluorenyl ligand bridged by a dimethylsilylene group, $C_{13}H_8SiMe_2NCMe_3$, were synthesized. The dichloro complexes $Zr(\eta^5\text{-}C_{13}H_8SiMe_2NCMe_3)Cl_2(L)$ ($L = THF, Et_2O$) were prepd. by reacting $ZrCl_4L_2$ with $Li_2[C_{13}H_8SiMe_2NCMe_3]$ and characterized as labile mono(solvent) adducts. Reaction with $MeMgCl$ gives the thermally sensitive di-Me complex $Zr(\eta^5\text{-}C_{13}H_8SiMe_2NCMe_3)Me_2(THF)$, whereas solvent-free dialkyl derivs. $Zr(\eta^5\text{-}C_{13}H_8SiMe_2NCMe_3)Ph_2$ and $Zr(\eta^5\text{-}C_{13}H_8SiMe_2NCMe_3)(CH_2SiMe_3)_2$, all under preservation of the chelate structure, are obtained with $PhMgCl$ and Me_3SiCH_2MgCl , resp. Variable-temp. 1H NMR spectroscopic data reveal a sterically

Searched by Barb O'Bryen, STIC 308-4291

congested ligand sphere around the Zr atom which is confirmed by a single-crystal x-ray diffraction study in the case of the bis[(trimethylsilyl)methyl] deriv. (shown as I). The substituted fluorenyl ligand is pentahapto-bonded with some variation of the Zr-ring C bond lengths. The amido N is trigonal planar as a result of significant π -donation to the Zr. The two (trimethylsilyl)methyl groups do not appear to be strongly distorted despite being bound to a 12-electron d0 center but give rise to a conformation in which the repulsion between the trimethylsilyl and the tert-Bu groups is minimized. This compd. crystallizes from pentane in the monoclinic space group P21/n with a 9.326(3), b 16.806(5), and c 19.638(6) .ANG., β . 93.23(2).degree., Z = 4, R = 0.0308, WR2 = 0.079.

AB The synthesis of seven new bridged zirconocenes is described, which make isotactic polypropylene when used in polymns. of propylene with methylaluminumoxane as cocatalyst. Their polymn. behavior in propylene and ethylene polymns. is examd. and discussed. Arom. substituents in appropriate positions of the zirconocene ligand frame result in catalysts with activities, stereospecificities, and polypropylene mol. wts. much higher than those of any previously described metallocene system. By structure variations it is demonstrated that the effectiveness of these substitutions strongly depends on their position and on a nonincremental synergism with

Searched by Barb O'Bryen, STIC 308-4291

alkyl substituents on the ligand frame. The high activities of the systems can be explained well by electronic effects, whereas steric effects obviously play the more important role for the high stereospecificities and high mol. wts. of the polymers.

AB Title compds. ZRZ (at least 1 Z = org. radical contg. cyclopentadienyl functionality and the other Z = cyclopentadienyl-contg. org. radical, Cl, Br, iodo) were prepd. by reaction of the precursor to Z with an alkali metal alkyl to produce the Z anion and reaction of the latter with XRX (each X = Br, Cl, iodo; R = C1-20 alkylene which may contain Ge, B, Si, P, N, Al, O or R = Ge, Si, B, Al, P, Sn). Thus, BuLi was added to a soln. of fluorene in THF and the mixt. was stirred 1 h, then added over 2 h

Searched by Barb O'Bryen, STIC 308-4291

to a stirred soln. of 1,2-dibromoethane in pentane. Work up gave 1-bromo-2-(fluorenyl)ethane.

AB Ethylene homopolymers and copolymers with .alpha.-olefins are prepd. with high mol. wt. and low polydispersity by polymn. in the presence of a catalysts contg. aluminoxanes and transition metal metallocenes. Thus, [(dimethylsilylene)bis(1-inden-1-yl)]zirconium dichloride [prepd. from (dimethylsilylene)bis(1-indene), BuLi, and ZrCl₄.2THF] was mixed (4.0 mg) with 30 mL 10.5% Me aluminixane and used to polym. ethylene at 65.degree./5 bar for 60 min., giving 300 g polyethylene with viscosity no. 323 mL/g, bulk d. 0.210, and av. particle size 50 .mu.m.

AB Title compd. (I), useful as an intermediate for organolanthanide
catalysts for ethylene polymn. or hydrogenation of various olefins,
is prepd. Thus, a THF soln. of 0.123 mol fluorene was treated
dropwise first with a hexane soln. of 0.123 mol BuLi and then with a
THF soln. of 0.0616 mol Me₂SiCl₂ at room temp. and the mixt. was
refluxed for 2 days to give bis(fluorenyl)dimethylsilane, 5 mmol of
which was stirred with 10 mmol KH in THF at room temp. for .apprx.20
h to give I in 60% yield.
